Human Natriuretic Peptide Receptor B.
NPRB; ANP; BNP; CNP; kidney failure; heart failure; protein kinase; hyperaldosteronism; glaucoma; guanyl cyclase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Natilizatic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.
The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having quantl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce

The sequence was derived from the DNA encoding natriuratic peptide receptor B, NPRB, having quanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuratic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                        Human Natriuretic Peptide Receptor B.

Introducing random point mutations into nucleic acods -

Introducing random point mutations into nucleic acods -

by prepn of single stranded template, annealing a primer, elongation,

misincorporation, completion of molecules and screening.

Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of

E coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligoniclectide was hybridised to

c it to generate a popn of DNA molecules which terminate at all

possible nucleotide positions within a specified region. The

variable 3' ends generated in this way are used as primers for

reverse transcriptase. Nucleotides are missincorporated by the

c transcriptase and the molecules are completed to forms that can be

amplified and then expressed in a suitable host-vector system.

C The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                             1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          108 Others;
                                                                                                                                                                                                            Oligonucleotide probe MK14'A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-MAY-1988.

```
Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain Disclosure; Page 35; 255pp; English.

Q70468 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides.This generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)62(NNB)7(TGC)(NNB)10Y. X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Generic DNA sequence to generate a random TSAR petide library. Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 051735-45 and 051747-59.

ont yare flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Cother specific peptides generated by these generic sequences are shown in R6151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonual cotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARS or compans. Comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, andioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    resulting proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins of screening a binding domain and an effector domain proteins.

Tromprizing a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Oldsclosure; Page 35; 255pp; English.

Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)10(TGC)2(NNB)42(NNB)8(TGC)(NNB).

Compressented as follows: X(NNB)10(TGC)2(NNB)42(NNB)8(TGC)(NNB).

That are not specified further. Other generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARS or compsis. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARS are easily characterised and have designed activity allowing direct and rapid detection in a screening process.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Random point mutations were introduced into the alpha fragment of E.coll beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

```

Generic DNA sequence to generate a random TSAR petide library.
TSAR; totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concatenated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.

LT 11 Q70465 standard; DNA; 114 BP. Q70465;

CC (7046) is a generic DNA sequence used to generate random TSAR peptide

CC (TGC) (NNB) 6Z (NNB) 2(TGC) (NNB) 14 (TGC); Y. X and Y are flanking restriction

Sites (X is not the same as Y) that are not specified further. This

PT Identifying proteins or peptide(s) which bind a ligand - by
recening a recombinant vector library expressing fusion proteins

PT Comprising a binding domain and an effector domain

PS comprising a binding domain and an effector domain

Disclosure; Page 35: 255pp: English.

COMO465 is a generic DNA sequence used to generate random TSAR (Totally

COMO465 is a generic DNA sequence used to generate random TSAR (Totally

CSYNTHETIC Affinity Reagants) peptides. This generic formula can also be
crepresented as follows: X(NNB)6(TGC)(NNB)11Z(NNB)14(TGC)(NNB)3Y. X

CC and Y are flanking restriction sites (X is not the same as Y) that are
corporated for their generated by these generic sequences are shown in

CC Specific peptides generated by these generic sequences are shown in

CC Comprising at least two functional regions. - a binding domain with

CC Affinity for a ligand and a second effector peptide portion that is

CC Chemically or biologically active. They may further comprise a linker

CC Chemically or biologically active moiety es metal ion,

CC That the expressed peptide contains 2 or 4 cysteine residues positioned

CC That the expressed peptide contains 2 or 4 cysteine residues

CC Comprise a chemically or biologically active moiety, es. metal ion,

CC deliver a chemically or biologically active moiety, es. metal ion,

CC deliver a chemically or biologically active moiety, es. metal ion,

CC addiostope, peptide, toxin or enzyme, to the specific target or on the

CC coll. They can also replace the function of macromolecules, eg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3 banbanbanbanbanbtgcanbanbanbanbanbanbanbanbanbanbanbanban
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing infect and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G; 2 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

CC Synthetic Affinity Reagents) peptides. This generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generate formula can also be represented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)12.

CC Synthetic Affinity Reagents) peptides (X is not the same as Y) that are not specified further. Other generic sequences are shown in 700466-68.

CC Ther specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in a R65151-54. TSARs are concatenated by these generic sequences are shown in Affiliaty for a ligand and a second effector peptide portion that is chemically or a ligand and a second effector peptide portion that is chantche expressed peptide contains 2 or 4 cysteine residues so that the expressed peptide contains 2 or 4 cysteine residues so that the expressed peptide contains 2 or 4 cysteine residues so that the expressed peptide or variant residues. These residues comprise, engines are also designed a companie, comprise a peptide, toxin or enzyme, to the specific target or on the concatenated and also replace the function of macromolecules, eg.

CC comprise and slow replace the function of macromolecules, eg.

CC concatenated and an also replace the function of macromolecules, eg.

CC concatenated and an also replace the function of macromolecules, eg.

CC concatenated and an also replace the function of macromolecules, eg.

CC concatenated and an also replace the function of macromolecules, eg.

Generic DNA sequence to generate a random TSAR-9 petide library.
TSAR, totally synthetic affinity reagent; synthetic; binding domain,
effector domain, concatenated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

expressing

a recombinant vector library

```
Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins PT Identifying proteins are comprising a bluding domain and an effector domain bisclosure; Page 35; 255pp; English.

Disclosure; Page 35; 255pp; English.

CO 70466 is a generic DNA Sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows:X(NNB)[CGC)(NNB)10(TGC)2(NNB)4Z(NNB)8(TGC)(NNB) CCC Synthetic Affinity Reagents) peptides generic sequences are shown in R65151-54. TSARS are concatenated by these generic sequences are shown in R65151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues. These positioned in, or flanking, the unpredicted or variant residues. These costiones confer some degree of conformational rigidity to the peptides.

CCC for the TSARS or compens. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal contains and therefore circumvent the need for complex methods of hybridoma formation or enzyme, to the specific target or monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production.

CCC The TSARS are easily characterised and have designed activity allowing distorts and read or the constant of the call of the constant of the complex methods of hybridoma formation or in vivo antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Distribute and the sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides This generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)17(TGC)(NNB)10V. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68. Other specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides, affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so
                                                                                                                                                                                                                                                                                                                                                                          that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.

// Organization was mascaraed with a modified // Organization was prince 1: Not I; Site_2: Eco RI; Ist strand cDNA was prince with a Not I : oligo(dT) primer [5]; strand cDNA was primed with a Not I : oligo(dT) primer [5]; strand cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digsted with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by Bento Soares and M.Fatima Bonaldo. RNA was kindly provided by Dr. Minoru Ko (Wayne State University)."
                                                                                                                                                                                                                                                                                                            Till (bases 1 to 250)

Caenorhabditis elegans (strain N2, ) (library: Yuji kohara unpublished cDNA) Hermaphrodite embryo embryo cDNA to mRNA.

Caenorhabditis elegans

Eukaryotae; mitochondrial eukaryotes; Metazoa; Nematoda;

Secernentea; Rhabditia; Rhabditida; Rhabditina; Rhabditidae;

Rhabditidae; Caenorhabditis.
